The new TS 99 FL, TS 99 FLR, TS 99 FLR-K

Exceptional ease for
even more door widths.

dormakaba 

Even good products can be further improved.

The new TS 99 FL/FLR with two new benefits for enhanced convenience.

In keeping with our own quality demands we have further increased the already high standards achieved by our classic TS 99 FL door closer, improving both its technology and its ease of operation.

Benefit No. 1:
New door widths.

The new TS 99 FL can now be used for door widths up to 1250 mm and is therefore particularly suitable for hospitals, homes for the elderly and care facilities, i.e. applications in where barrier-free accessibility plays an important role.

Benefit No. 2:
New ease of operation.

Thanks to the improved free-swing function, all doors fitted with the TS 99 FL can now be operated with ease and convenience. The resistance previously felt on initial opening has been eliminated. This is

advantageous for childcare centres, schools and senior citizen facilities of all kinds.

TS 99 FL

Safety in case of fire

The TS 99 FL is a door closer that can be installed in combination with a smoke detector system (e.g. RMZ) to create the TS 99 FLR or TS 99 FLR-K. Both systems allow the door to swing freely and close it reliably in case of fire.

The right product for so many target groups.

- For the trade, the TS 99 FL is an ideal complement to any sales portfolio thanks both to its universal applicability to single and double doors (on active leaf only) and to the ease of order handling derived from a clearly structured range. A further decisive argument is that it offers the uniformity of appearance inherent in the dormakaba Contur design.
- For the installer/fabricator, fast and easy installation and fixing flexibility with normal and transom arrangements are major advantages.
- For the architect/specifier, the TS 99 FL ensures compliance with legal requirements for barrier-free building.
- For the user, the easy opening action of the door makes it a pleasure to operate. Added to this is the high degree of occupant safety achieved through the contribution made by this system to passive fire protection.
