Support and Guide Elements
The right stacking arrangement for any situation

Perfect parking every time
Existing structures or unusual layouts often require special solutions, particularly in the design of the stacking area. dormakaba HSW systems can be parked in a range of different positions. The stack of panels can be aligned parallel or square to the frontage, be readily visible for effect or hidden behind columns etc. Another possibility is that of parking the system in line but out of the way, whether behind a wall or in a niche (see also pages 8). The panels can also perform certain functions when the frontage is open, such as providing the sides of internal store windows and showcases, or, if provided with the appropriate printing on the glass, for adding artistic value to a wall. The following pages show some system solutions devised in answer to a wide range of different problems.
Panels transverse to travel direction

Panels stacked 90° angle transverse to travel direction

Niche stacking. With pivoting end panel, single- or double-action, to use as possible access leaf (left or right, or left and right).

Stacking with reshuffle bypass (without pivoting end panel). Behind wall projection/fixed side panel (Left or right, or left and right).

Stacking behind pivoting end panel, single-action or double-action (Left or right, or left and right).
### Support and Guide Elements

#### Stacking arrangements

**Panels stacked 90° angle transverse to travel direction**

- **Product description**
  - Stacking in a box or niche, behind pivoting end panel, double-action
  - Sliding panels only, around 135° offset
  - (left or right, or left and right).

**Stacking in a box/pocket.**
- For sliding panels or double-action sliding panels
  - (left or right, or left and right).

**Stacking behind column.**
- Stacking legs at 135° angle.
  - With pivoting end panel, double-action, to use as possible access leaf
  - (left or right, or left and right).

**Stacking at acute angle.**
- All panels brought into position with rear track roller.

Simple, secure and removable connections

Plug connection of tracks and modules
To provide fast, easy and flexible installation of the track rail sections and the modules it is a considerable advantage when all parts are delivered unwelded. The special HSW track rail design with two parallel channels at the top (suitable for M 10 screws) simplifies the work on site.

- The single track rail sections and modules are connected to each other by special clamp inserts fitted in the provided channels, delivering secure connection.
- If necessary even adjustment cuts of track sections can be done on site.
- In the lower part of the track rails additional pins provide smooth and even passage for the roller carriers.
- Even the stacking construction is fitted together and connected to the frontage track rail in the same way.
- As an option parts of the stacking construction can be delivered pre-mounted.
- The segmentation is realized by mitre cuts and welded connections within single track rail sections as supplied condition. On site the adjacent track rail section then can easily be fitted in a straight line by clamp inserts and pins.
Single track rail section

Stacking construction

Segmented track rail section
Flexible and stable
Horizontal sliding walls can be constructed in a wide range of different configurations to suit the site of installation, prevailing structural conditions and the planning concept. With dormakaba HSW systems, a variety of designs can be implemented with ease. Straight and segmented track rails can be combined to produce virtually any serpentine shape required. The track rails in the form of hollow sections combine all the virtues of lightweight, stability and torsional stiffness. And when combined with the HSW substructure, installation becomes even easier. Flexibility and stability mean that even unusual system configurations can be implemented without problem to give maximum functional reliability.

Straight track rail

Track rail at stacking area

Track rail at assembly frontage

90° T-piece
Straight track rail
For a straight-line system configuration, a drill hole interval of 300 mm in the track rail is sufficient, while the stacking area requires an interval of 100 mm. Where the track assumes an angle of 161 – 179°, the track rail is mitred, while at angles between 90 and 160°, a segment is incorporated. The standard modules available are indicated in the adjacent illustrations.
**Segmented track rail**

With the segmented track rail, it is possible to implement the dormakaba HSW as a polygonal partition or frontage. In so doing, it is essential to note the following requirements:

- The panel width and segment chord length must be properly coordinated;
- Segment panels are provided at the bottom with locks or face-mounted floor bolts
- It is important to ensure that the opening sweep of single-action and double-action panels does not give rise to collisions.

**Curved track rail**

The curved track rail is offered for installing a rounded track rail of a DORMA HSW system. The following technical conditions are applicable here:

- Only sliding panels can be used in the curved track rail area
- The curved track rail must be foregone in the stacking area
- A top locking device cannot be installed. Each panel gets two front locking devices
- In case of installation in the stacking area, a 100 mm long piece of straight track rail is required
- Tails of the curved installation can be designed with standard modules
- Min. bending radius is 3,500 mm (smaller radius upon request)
- If elliptic system configurations are required, it is decided in each individual case. Drawings are required for this
- Curve start and curve end are principally performed with a 90° saw cut (rotary saw cut)
Space for your notes
Substructure – the system

Solutions
Installing a horizontal sliding wall system invariably requires a certain set of structural conditions to be established. The system will need to be precisely aligned vertically – usually subsequent to installation – as well as being exactly configured and securely located.

Because dormakaba HSW systems do not use floor-level supports and floor tracks, the system requirements and all their technical properties must be taken into account when designing the substructure and its incorporation within the ceiling. This often very costly planning process is normally undertaken by the fabricator as the installation company, and alongside the calculations there are many individual structural and installation procedures involved.

The new dormakaba substructure system is of modular construction and is designed to significantly reduce on-site installation cost and time. This concept also offers the particular flexibility required to overcome structural constraints, such as the presence of air conditioning shafts or pre-existing electrical systems in the ceiling.

System design
The dormakaba substructure consists primarily of the following components: substructure profile with modules for branching to the stacking area, threaded rods for suspension of the profile(s), and standard square section tubes with appropriate fixings and ceiling brackets for bracing and stiffening the construction.
Substructure Support and Guide Elements

- Standard square section tubes
- Pivot fixing
- Substructure profile
- Upper bolting channel
- Centre channel
- Lateral bolting channel
- M10 threaded rod
- Fixing plate
- Pivoting angle bracket
- Milled "U" recess

Diagram showing the components of the substructure support and guide elements.
**Safety and flexibility**

The dormakaba substructure has been developed on the basis of extensive practical experience of the requirements involved in this kind of system. Consequently, the profile incorporates features that greatly facilitate installation and ensure that pre-existing structural factors can be accommodated with maximum flexibility.

Various bolting channels run the whole length of the profile, allowing bolts to be inserted easily at any location within the system configuration. So there is no need for pre-drilling and thread cutting in order to mount the track rails onto the substructure.

Bolted connections can be made directly through the lower bolting channel. The problem of removing drillings and filings from the track rails is thus also a thing of the past.

Bolting channels on both sides of the profile can be used e.g. for fixing the brackets needed for attaching the ceiling retention elements. In addition, centering grooves on all main profile surfaces facilitate overhead drilling, e.g. for accessory attachment. Welding brackets designed for bolting onto the profile provide another option, allowing the dormakaba system to be utilised for additional customer-specific applications.

The substructure profile is suspended from threaded rods. These are first placed in the U-recesses using fixing plates that lock into the upper bolting channel. Each pair of threaded rods is regarded as constituting one suspension point. Here again the system remains exceptionally flexible: the staggered U-recesses positioned at intervals of 100 mm enhance the ability of the system to accommodate structural constraints. Depending on the weight of the system and the permitted deflection, it is possible to span a distance of up to 2,100 mm between two suspension points.

The centre channel can be fitted with two flat aluminium bars to provide additional rigidity in the area of butt joints between profiles. In this case it is possible to dispense with the dual suspension arrangement – with one suspension point either side of the joint – which is otherwise necessary. So existing building installations of all types can be effectively bypassed.

Once the substructure has been installed, the HSW system is vertically aligned and fixed directly via the threaded rods. Subsequent adjustments, e.g. after the building has settled into its foundations, can also be carried out by the same means.

The standard square section tubes offer extra safety, especially where the sliding panels deviate from a straight line. Panel sway must be effectively countered by the structural design adopted at such locations.

Diagonal struts that counteract the pressure load stabilise the system in the area of the stacked panels. The telescopic square section tubes are connected as additional bracing elements (struts) to the substructure by a pivot fixing. The struts are bolted to the ceiling using the appropriate angle brackets.

The modular design of the dormakaba substructure is precisely matched to the modules of the dormakaba HSW track rail. The structural elements can be mixed and matched as desired with the result that a small number of component types is sufficient to create a complex, flexible system that conforms fully to all safety requirements.

A drawing of the required sub-structure can be requested from dormakaba to supplement the HSW system drawing always supplied with the quotation.
The forces (shown by arrows) that occur during opening and closing of the sliding wall system must be absorbed by appropriately located bracing elements.
Planning details

Calculating the suspension intervals

With a maximum load (panel weight) of 150 kg/m and a permitted deflection of the substructure with track rail of 2 mm, the interval between two suspension points must be no greater than 1,450 mm. The table below shows other values for different loads.

In order to prevent system sway, every second suspension point must be reinforced by a strut. The substructure profile ends (travel path and stacking area) should ideally be directly connected to the masonry or to existing structural members.

Illustrative example of load values

HSW EASY Safe characteristic values

Formula for calculating the:

- Glazing height
  - system height – 309 mm
  - panel height – 193 mm
- Glazing weight
  - Glass 10 mm = 25.00 kg/m²
  - Glass 12 mm = 30.00 kg/m²
- Door rail weight
  - Aluminium = 12.00 kg/m
  - Brass = 14.50 kg/m
  - Stainl. steel = 13.25 kg/m

Example system

HSW EASY Safe system in stainless steel

System height = 3.5 m
Glazing thickness = 12 mm

Calculation

Load
- glazing weight x glazing height + door track weight
- 30 kg/m² x (3.5 m – 0.309 m) + 13.25 kg/m
- 30 kg/m² x 3.191 m + 13.25 kg/m
- 108.98 kg/m
Stacking area design

The construction of the stacking area, assembled from substructure and track rail modules, provides a good illustration of how this well-designed system can be utilised. The individual components are coordinated to ensure safe integration. Joints in the substructure are offset to those in the track rails so that individual joints coincide with continuous material in all cases.

Provided that the track rails are adequately bolted to the substructure, gaps of up to 40 cm measured from one suspension point to the next are permitted in the substructure.

View from below

View from above

Joints reinforced by central steel bar only require one local suspension point.

Suspension points either side of joints not reinforced by central steel bar.

Panel Systems
HSW EASY Safe
Security in use and elegance in design

**Outstanding strengths of the HSW EASY Safe system:**

- The optional safe use of laminated safety glass increases security and also widens the creative possibilities.

- A visible status display with a clear colour system indicates the status of the top locking device on the single-action sliding panel or double-action sliding panel. This gives a better overview and even more security.

- Double brush seals in the top and bottom door rails, successfully minimize drafts.
Intelligent solutions for more convenience and security
HSW EASY Safe – More clarity and easier locking thanks to status display

**Locking status at a glance**
Security and convenience in one: The top door locking device clearly shows the locking status of the door panel on the status display. This gives the user a greater feeling of reassurance and security.

**Less draft for even greater comfort**
Innovative double brush seals in the top and optional in the bottom door rails improve door closure and noticeably minimize the amount of draft. The vertical brush seals, which are also optionally available, can be fitted up to the full height of the panel and give additional draft proofing – for noticeably greater comfort.
Simple locking with hand or foot
Multilock – Three locking possibilities in one component

The new Multilock system opens up a new world of simplicity
The Multilock combines three locking possibilities in one compact element and can be installed effortlessly in the bottom door rail.

Easy foot-operated opening and closing

Simplicity with clear benefits:
The 3-in-1 Multilock can be offered in three options for secure locking: side locking device, front locking device or cylinder lock.

• Maximum convenience with foot-operated locking options for the face-mounted floor bolt – simple and hassle-free.
Innovative hold for more security
VSG – Improved security with the optional use of laminated safety glass

Creative freedom combined with security
Thanks to the innovative Clamp&Glue bonding technology, the HSW EASY Safe system allows the use of highly secure laminated safety glass. With the insertion of inlays within the laminated safety glass, the horizontal sliding wall can be used as a custom design element, thus setting new standards in interior design.

Hassle-free installation thanks to the new Clamp&Glue technology
The fixing process with HSW EASY Safe is incredibly simple. The special adhesive is fed through an injection hole in the two upper door rail halves to the adhesive channel where it spreads out evenly. After a drying time of just 15 minutes the panel can then be installed.

Attractive added value:
• Laminated safety glass makes the application of HSW EASY Safe not only attractive, but also more secure.
• The innovative Clamp&Glue technology enables easy bonding and also ensures that fittings and LSG (from TSG) are held firmly in place.
• Special inserts in the laminated safety glass offer huge design freedom as well as additional functions such as protection from the sun, noise reduction and privacy screening.

The inlay can be gradually pressed out using clamping force. The bonding of the glass with the fitting prevents the fitting from slipping out of the glass due to possible decrease in clamping force.
**HSW – Transparent versatility**

Horizontal sliding walls are used in a wide range of different project types, and for both internal and external applications. These partitions can be flexibly designed to suit the site of installation, structural conditions and design concept. They can satisfy a broad spectrum of requirements in relation to styling, material and finish or colour, and can also be equipped with individually fabricated panels to perform special functions. Additional utilisation of the dormakaba substructure allows a simple, reliable and secure installation of the entire HSW system.

**HSW – Horizontal Sliding Walls**
Panels slide individually – stacking track required

**HSW EASY Safe**
Glass assembly with top and bottom door rail

**HSW-GP**
Glass assembly with single-point fixings.

**HSW Horizontal Sliding Walls, fully framed**
Panels slide individually – stacking track required

**HSW-R**
Fully framed for toughened safety glass, laminated safety glass or double glazing
Panel Systems

Product overview

HSW EASY Safe
With the HSW Easy system, the panels create a continuous transparent face completely without side frame elements. Under certain circumstances, an additional wind deflector can, however, be provided at the glass edges as a preferred option.

FSW EASY Safe
The FSW EASY Safe folding sliding wall system offers both high transparency and enhanced user safety. Door rails top and bottom and roller carriers at the end of every second panel make it ideal for inline configurations. Visually compatibility with HSW EASY Safe panels means that both systems can be effectively combined in the access frontages of a building.

HSW-GP
A defining characteristic of the HSW-GP is the single-point fixings that hold the glass in combination with the conventional track rail profile. The design with its high-quality stainless steel elements and glass-flush single-point fixings provides a perfect complement to contemporary architecture.

HSW-R
The HSW-R sliding glass panel frontage is suitable wherever likely to be exposed to high wind loads – for example, for shop windows and store entrances located in the façade/on the outside of the building. Aluminium alloy frames clamp the glass on all sides, with lateral rubber lip seals and double brush seals top and bottom providing added weather protection.

Panel design

With the features that the different panel types have in common, HSW EASY Safe satisfies all the requirements placed on transparent façades in the typical applications that arise.

- All panel types are provided with a bottom and a top door rail, which hold the glass safely.
- HSW assembly only with sliding panels, pivoting end panels and fixed panels can do without an additional carrier profile. For single- and double-action sliding panels the carrier profile is indispensable. When an assembly incorporates single- or double-action sliding panels then the carrier profile is provided for all panel types.
- The glass panes can have the following glass thicknesses: 10 mm, 10.8 mm, 12 mm, 12.8 mm, 13.5 mm, 15 mm, 17 mm and 19 mm. (tolerance range +/- 0.5 mm)
- When using laminated safety glass the Clamp&Glue technology provides secure hold without the need for glass drilling.
- The top panel profile (either door rail or carrier profile) incorporates a double brush seal as standard. As an option, the bottom door rails can have double brush seals as well.
- Excellent draft protection is reached when additional sealing profiles with matching double brushes are used at the vertical glass edges as well.

HSW EASY Safe is certified to have reached the following tests:
- Wind load (Frame bending): EN 12210 Class 1
- Endurance strength: DIN EN 1527 Class 3 and DIN EN 1191 Class 3
- Side impact: DIN EN 13049 Class 5 (highest class)
- Corrosion: DIN EN 1670 Class 4
- EPD (Environmental Product Declaration): ISO 14040
In the all-glass version HSW-GP, the panels without frame form a continuous, transparent face, with the use of single-point fixings creating a fine, elegant appearance.

The all-round frames of the individual panels of an HSW-R system offer not only high stability but also effective protection against external influences, with the option of either laminated safety glass (LSG), toughened safety glass (TSG) or double glazing units for the glazing.
## Panel functions

</tbody>
</table>

The individual panels can also be of differing widths. The largest width should not exceed max. 115% of the smallest width.

* For these panel types please consider our notes on portal systems on page 107.

** Note: The maximum permissible weight relates to the complete door assembly, including handles.
Irrespective of the function of the individual panels, an HSW EASY Safe system comprises the following basic components:

01 Two parallel channels suitable for M 10 screws and clamp connectors

02 Track rail

03 Roller carrier

04 Double brush seals on top (bottom layout is optional)

05 Carrier profile

06 Top door rail and (consisting of basic profiles, cover profile and lateral end caps)

07 Rubber seal, bridges the gap between cover profile and glass panel

08 Toughened safety glass or toughened laminated safety glass 10–19 mm (by others)

09 Bottom door rail, both comprising base profiles with cover profiles and end caps
Pivoting end panel

**single- or double-action**

Pivoting end panel, single- or double-action, with floor pivot
Non-moving and always equipped with a locking dead-lock and the option for an additional upper locking unit.
Pivoting end panel, single-action
with stop-type end caps top and bottom.

Pivot point variants:
- Floor pivot with round spindle, optional combined with DORMA TS 92 overhead door closer*
- BTS 84 for panels up to 100 kg, with optional hold-open at 90° door opening angle
- BTS 80 for panels up to 150 kg with adjustable hold-open device

Pivoting end panel, double-action

Pivot point variants:
- Floor pivot with round spindle
- BTS 84 for panels up to 100 kg, with optional hold-open at 90° door opening angle
- BTS 80 for panels up to 150 kg with adjustable hold-open device

Sliding panel

Basic movable panel without additional function.

The sliding panels are movable. Once in their closed position, they are locked. The locking components provided in the bottom door rail can be face-mounted slide bolts, end-mounted slide bolts, end pin bolts or deadlocks.

The structure of the bottom door rail applies also to single-action/double-action sliding panel.

Bottom door rail with face-mounted slide bolt

Machining of cover profile (face-mounted slide bolt)
**Bottom door rail with face-mounted slide bolt on both sides**

**Machining of cover profile (face-mounted slide bolt)**
This panel type is installed where doors only need to be opened in one direction, either inward or outward. In both cases, the cam-action door closer is fixed to the internal side of the assembly. If you are considering this panel type, please note our advisories relating to portal systems on page 107.
Standard assembly

top: Pivot bearing, TS 92 with slide channel, one locking device.
bottom: Face-mounted slide bolt as pivot (released for sliding function), deadlock.

Optional equipment

top: Additional locking device (upper locking unit) to secure the panel in the area of a reshuffle bypass or for more stability in closed position (Illustration see page 40).
bottom: Second face mounted slide bolt instead of deadlock.

Double-action sliding panel

with integrated DORMA door closer ITS 96, 2–4.

Being virtually invisible, its presence has no effect on the overall appearance of the partition. In its standard form, ITS 96 is provided with a 90° hold-open. If you are considering this panel type, please note our advisories relating to portal systems on page 107.

Hole of pattern
upper locking unit

Standard assembly

top: Pivot bearing, ITS 96 with slide channel, one locking device
bottom: Face-mounted slide bolt as pivot (released for sliding function), deadlock

Upper locking unit

Optional equipment

top: Additional locking device (upper locking unit) to secure the panel in the area of a reshuffle bypass or for more stability in closed position.
bottom: Second face mounted slide bolt instead of deadlock
Additional upper lock
The additional upper locking bolt is used for single-action or double-action sliding panels as an optional addition to the upper locking unit at the other end of the door. In some cases it is recommended for additional stabilization of the carrier profile.
Fixed panel

Non-moving side panel, independent of the rest of the system. The fixed side panels are of the same basic design as the sliding panels and continue the appearance of the movable part of the frontage without any optical break. If required, the retaining devices at the top can be replaced by a carrier system to convert such a panel into a sliding panel.

Standard assembly
- **top:** Retaining devices fixed to the track rail.
- **bottom:** Spacer profile fixed to the floor; access for fixed end pin of the adjacent panel.

Glazing height = Total height - 308 mm

Panel width = 9
Offset hung end panel

Single action panel, non-sliding, operates independently of the rest of the system. The single action door with offset pivoting arm assembly can be swung around 180°, so leaving the entire operating zone free. A bottom deadlock secures the closed leaf.

Position 90° and 180° opening angle at wall position 180° opening angle at fixed panel

180° opening angle Offset hung end panel at fixed panel

Max. panel weight 100 kg

Pivoting end panel views as seen from below
**Sliding / folding panel**

Hinged, with lock and slide bolt at the bottom, latching bolts top and bottom for fixing the final folding panel to the slide panel.

**Max. panel sizes and weights**
- Max. panel width: 2 x 1,000 mm
- Max. system height: 3,000 mm
- Max. panel weight: 2 x 70 kg

**Magnetic door holders top and bottom**
- X = 110.5 mm (usage end mounted locking bolt)
- X = 280 mm (usage lock module)

**End mounted slide bolt**

**Panel hinge**
Space for your notes
Types and functions

**FSW toughened glass folding walls featuring door rails top and bottom and a roller carrier at the end of each second panel.**

FSW folding sliding walls are suitable for linear configurations. With an FSW EASY Safe assembly, you can have either two or four panels (a basic panel and 1 or 3 folding panels) linked together. Where two counter-running (bi-parting) assemblies are installed, it is possible to create frontages with up to eight FSW panels.

As the panels are visually compatible with the HSW EASY Safe pivoting/sliding panels, and both systems use the same track design, shop/store frontages or similar transparent partition systems can be made up of these two different types, with the FSW assembly at the free end or supplemented by a single- or double-action HSW end panel (types 4+5). FSW systems can be designed for either opening direction.

**Example: Design with 2 x 2 panels (type 1c), bi-parting**

Types and functions

Toughened glass folding partitions with door rails top and bottom roller carrier at panel centre

The FSW EASY Safe C is adaptable to large spans. An assembly comprises a basic panel, up to 6 folding centre panels and a folding pivoting panel which, when the system is closed, can be used for access (alternatively, a non-attached single or double action end panel can be used). The number of panels therefore ranges between 3 and 8. As the roller carriers are centrally arranged on the centre panels, the basic panel must be designed as a half-width unit (plus pivot offset of 65 mm). The pivoting access panel can be of either basic panel or centre panel width. The slightly offset hinges mean that the panels can be folded into particularly compact stacks, with high stability also ensured. Available as standard for glass thicknesses of 10 or 12 mm. Other glass thicknesses and models with laminated safety glass also available on request. Please indicate your requirements when ordering!

Example: Partition type C2 (symmetrical with narrow pivoting access panel)

01 Pivot bearing top and bottom
02 Basic panel
03 Track rail
04 Roller carrier
05 + 07 Flap panel unit
06 Folding hinge

Types and functions

Access with convenience – the plus you get with the FSW EASY Safe Cplus

Based on the design of the FSW EASY Safe Cplus, the model variant FSW EASY Safe Cplus offers the possibility of including a flap panel as a fully fledged access door when the system is otherwise closed – with all the automatic closing convenience which the DORMA TS 93 G cam-action door closer can offer. The special bottom lock bolt and the top clamp-fitted stop serve to stabilize the first panel of the flap panel unit in this configuration. The top angle stop ensures the correct positioning of the closed flap panel unit. The folding hinges connect both panels of the flap panel unit and offer a larger pivot offset in order to create space for the door closer and pull handles. All the other folding panels are equipped with standard hinges and roller carriers.

HSW-GP panels and functions

Fully glazed sliding walls, point-fixed with standard track rail.

The characteristic features of HSW-GP systems are the single-point fixings of the glass panels in combination with a conventional track rail profile. The design, featuring a high-grade stainless steel finish and the distinctive flush-mounted or clamping disc attachments, coordinates perfectly with contemporary architecture. Even curved glazing can be securely held by this system. And this can also be combined with curved track rail profiles to produce unique configurations. Combined with curved track rail profiles special system configurations can be enabled. The standard glass thickness is 10/12 mm. Further glass thicknesses on request.

</table>

The track roller position cannot be varied. The width of all panels in the system must be uniform.

* From a panel height of 2,500 mm, we recommend a continuous pivot rod extending over the full height of the panel.

From a panel height of 2,700 mm, we recommend a fifth single-point fixing.
System design

The HSW-GP system consists of the following basic components:

01 installation-efficient dormakaba substructure to accommodate track rail mounting requirements (optional).

02 track rail (for bolting to the substructure).

03 roller.

04 roller bolt.

05 strap with single-point fixings.

06 toughened safety glass or toughened laminated safety glass (by others).

07 bottom strap with end-mounted pin.

08 bottom strap with face-mounted slide bolt.

Sliding panel with bottom end-mounted pin

Sliding panel with bottom face-mounted slide bolt
Types and glass preparation

- Visible corner notches, bottom
- Bottom pivot for pivot rods

---

**Sliding panel**
- HSW-GP sliding panel für 10 and 12 mm Glas
- Straps with single-point fixings
- Bottom strap with face-mounted slide bolt

**Fixed panel**
- Straps with single-point fixings
- Fixed panel strap

**Glass preparation**
- Glazing width
- Glazing height: Total height - 126 mm
- Countersunk bores for pivot rod
- Visible corner notches

**Glass bores and notches**
- Countersunk bores for single-point fixings for the pull handles and straps
- Bores for flush single-point fixings for TSG/LSG
- Bores for pull handle pairs
- Bores for locks

**Special stop**
- Pivot rods (short type) with single-point fixings and connecting tube
- Visible corner notches, bottom
- Bottom pivot for pivot rods

---
Types and functions

Horizontal sliding walls, framed all round for toughened safety glass, laminated safety glass or double glazed units

Resistant to mechanical stress, protect against the influences of the weather, heat loss and drafts thanks to sturdy profile frames with brush seals top and bottom and laterally arranged rubber lip seals. Optionally prepared for single pane toughened safety glass (TSG) or laminated safety glass (LSG), insulating glass/ double glazing or special glass. Frame profiles for 8 to 24 mm. Other glass thicknesses on application.

*The individual panels can also be of differing widths. The largest width should not exceed max. 115% of the smallest width.

* For these panel types please consider our notes on portal systems on page 107.
Irrespective of the function of the individual panels, an HSW-R system comprises the following components:

01 Installation-efficient dormakaba substructure to accommodate track rail mounting requirements (optional)

02 Track rail (for bolting to the substructure)

03 Carrier

04 Suspension assembly

05 Adapter frame

06 Glazing frame profile, horizontal

07 Glass clamping bar

08 Glazing frame profile, vertical

09 Toughened safety glass, laminated safety glass or double glazing units (by others)

10 Bottom frame profile.
**Single/double-action panels**

**Pivoting end panel, single- or double-action, with floor pivot**

Non-moving and always equipped with bottom deadbolt with the option of a top bolt or side action deadlock. Single-action or double-action options.
Pivoting end panel, single-action
with stop plates at the top bolt.
Assembly types:
• Floor pivot with round spindle
• As above, but with DORMA TS 73 or TS 92 overhead door closer
• BTS 84 for panels up to 100 kg, with optional hold-open at 90° door opening angle
• BTS 80 for panels of 100–150 kg, provided with hold-open as standard

Pivoting end panel, double-action

Single-action sliding panel

with integrated DORMA ITS 96 concealed door closer, size 3–6

This panel type is used where passdoors only need to be opened in one direction. The single-action sliding panel can be configured for either inward or outward opening.

**Standard assembly**
- top: Pivot bearing, ITS 96, size 3–6, one locking device
- bottom: Face-mounted floor bolt as pivot (released for sliding function)

**Optional equipment**
- top: Second locking device (for reshuffle bypass stacking)
- bottom: Optional second face-mounted floor bolt or deadlock

**Locking device**
Double-action sliding panel

with integrated DORMA ITS 96 concealed door closer, size 3–6

Double-action sliding panels with DORMA ITS 96, size 3–6 door closers are characterised by their exceptional ease of installation and operation. These passdoor panels are generally equipped with a bottom deadlock and top locking device plus a bottom floor bolt operating as the pivot bearing (released for the sliding function). The ITS 96 does not feature a hold-open function as standard.

For these panel types please consider our notes on portal systems on page 107.

Vertical seals – overview

With regards to material, fixing and the grade of draft-proofing different solutions are available.

Retrofittable seals
The plastics profiles shown below provide an unobtrusive and retrofittable solution for draft protection at the glass edges.

<table>

</tr>
</tbody>
</table>

Glass joint gasket
Milky transparent rubber, self adhesive for 10–19 mm glass thickness.
Vertical sealing profiles with brushes

The aluminium sealing profiles are fixed to the full height of the panels, replacing the end caps at the top and bottom door rails. They are individually tailored to the requirements of the bottom door rails, so they are already prepared for the locking devices such as end caps, end pins when delivered by dormakaba. At the top, a degree of extra length is provided to enable precise sealing profile adaptation to the exact panel height on site once the system has been vertically aligned. The double brush seals interlock with those at the adjacent panel and continue in line with the double brush seals at the top and bottom door rails. This ensures excellent draft proofing.

Art. No.
8.40.070.000.99
Vertical sealing profiles – panel types

Single-End-/Double-Action Panels

As-delivered condition of the vertical sealing profiles:
Cut lengths supplied from factory
= System height – 90 mm

Holes and recesses are pre-machined in the profile for the bottom door rail only. Any further machining work required for connection to the top door rail has to be performed on site.

Installation instructions
When fitting the top and bottom door rails please ensure that the protrusion of the glass width on either side of a door rail is even. In case the panels incorporate a carrier profile a proper section of the double brush sealing profile is fixed to the carrier profile by a fixing cartridge. Prior to machining the sealing profile at the top for the exact length from the bottom to the top door rail, first hang the panels from the track rail and align. After the installation the vertical seal profiles need to be fixed with permanently elastic glue.
Vertical sealing profiles – panel types

Sliding panels

As-delivered condition of the vertical sealing profiles:
Cut lengths supplied from factory
= System height – 90 mm

Holes and recesses are pre-machined in the profile for the bottom door rail only. Any further machining work required for connection to the top door rail has to be performed on site.

Installation instructions

When fitting the top and bottom door rails please ensure that the protrusion of the glass width on either side of a door rail is even. In case the panels incorporate a carrier profile a proper section of the double brush sealing profile is fixed to the carrier profile by a fixing cartridge. Prior to machining the sealing profile at the top for the exact length from the bottom to the top door rail, first hang the panels from the track rail and align.

Space for your notes
Pull handles, door knobs and recessed pull grip

The pull handle/knob system is designed for glass of 8, 10 and 12 mm thickness.

The pull handles can be fixed to both sliding and pivoting (swing) doors on one face using the appropriate connectors or on both faces by through-bolting (back-to-back arrangement).

Due to a flat structure recessed pull grips are also suitable for sliding doors.

The single-point fixings and through bolts are included as standard equipment in the scope of supply.

The pull handles can be fitted horizontally, vertically or in a handrail arrangement.

Important site measurements

[Diagram showing various measurements such as height of structural ceiling, substructure height, clear width (finished wall), track, HSW system height, top surface of structural floor, top surface of finished floor, FFL, stacking area width, stacking area depth, reshuffle bypass, system front = system width, metre mark (site reference dimension).]
Notes on portal systems

Maintenance recommendation for high-frequency HSW systems

Horizontal sliding walls with glass panels have been developed in order to provide retail outlets with generous and enticing frontages – entrances that offer easy accessibility and an inviting appearance for customers. When the frontages are closed, they can double up as expansive shop windows.

In cases where double-action sliding panels are used for main entrances as a portal system (i.e. in shopping malls or as similar operated HSW systems) they are submitted to very high daily traffic volumes and usage frequency rates.

The door closers and pivot bearings used by dormakaba have been successfully tested in accordance with the requirements of EN 1154. EN 1154 specifies 500,000 test cycles for manually operated closing devices. High-frequency portal systems such as the above can reach this number of cycles after just a few months. Consequently, dormakaba recommends that such units be regularly maintained. The higher the usage levels, the more frequently the equipment should be serviced by either the installation firm or a similarly specialized fitter.

In addition to any door closer that may be fitted, a suitable opening limiter (to be provided on site) will also be required as protection for single-action and double-action sliding panels. In the case particularly of public and highly frequented entrance systems, door closers are unsuitable as opening limiters as any excess pressure applied to doors will lead to high stress forces being applied at the sweep maximum.
Finishes

Deviations in colour due to production procedures cannot be totally excluded.

HSW systems with surface finishes 700 and 701 contain different component materials.

In the case of FSW (folding sliding walls) systems, for example, the folding hinges are always of aluminium, while the standard surface finish for brush profiles and end covers is black anodised (E6/C35). These various components can also optionally be anodised or powder-coated so that they resemble the ordered surface finish. The standard surface of upper locking units and upper locking bolts is a powder-coated RAL colour.

Typical manufacturing flow marks appear when anodising the milled area of the track rail modules. As an alternative to the anodized EV 1 surface finish, we therefore offer modules and track rails in all lengths in a powder-coated version similar to EV 1 for visual reasons.

### Safety-related information

**Important safety-related information for the mounting and use of dormakaba glass fittings.**
(Follow these instructions in addition to the mounting and operating instructions in order to avoid damage of product and damage to person or property.)

**Important:** All users have to be informed about relevant points mentioned in these safety-related information and the mounting and operating instructions!

**Allgemein**
1. dormakaba recommends using TSG-H (heat soaked toughened safety glass) to DIN EN 12150-1.
2. dormakaba glass fittings are not suitable for application in rooms where chemicals (e.g., chlorine) are used such as indoor swimming pools, saunas or salt-water pools.
3. Never move sliding panels faster than walking speed and always stop the door manually before it reaches end position.
4. Do not shut swing doors with excessive force. Install door stop to prevent door from opening too far.

**Mounting**
1. Only properly qualified and specially trained staff is authorised to mount dormakaba glass fittings.
2. Never use glass with conchoidal fractures and/or damaged edges.
3. Due to crushing hazards – among others in the area of the secondary closing edge – and possible injury caused by breakage of glass during mounting, corresponding protective clothing (especially gloves and protective goggles) is required.
4. Clean clamping area with fat solvent (standard commercial cleaning agent) before mounting the glass fitting.
5. Never use clamping shoes on structured glass surfaces (except on satined glass) or glass of heavily varying thickness unless with a corresponding levelling layer.
7. When adjusting glass elements, always stick to the required clearance for the respective fitting. Adjust clearance so that the glass does not touch hard components such as glass, metal or concrete.
8. Make sure not to use excessive force when installing the glass (avoid local stress resulting from very tight screws).

**Maintenance**
Check fittings at regular intervals for proper positioning and smooth running and door for correct adjustment. Especially highly-frequented door systems require inspection by properly qualified staff (specialised companies or installation firms). Immediately replace damaged glass elements (no glass flaking and/or conchoidal fractures)!

**General care instructions**
The surface finishes of the fittings are not maintenance-free and should be cleaned according to their material and design.
- For metallic surfaces (anodised finishes, stainless steel) please use appropriate cleaning agents without abrasive additives only.
- For varnished surfaces please use appropriate solvent-free cleaning agents only.
- Brass surfaces (without surface protection) have to be treated with an appropriate maintenance agent on occasion, to avoid tarnishing.

**For practical planning, please use our drawings dormakaba DETAIL.**

---

The printed colours indicating the surface finishes are not 100% true, but do provide a useful guide.

Statements made with regard to the nature or use of the products are for the purposes of descriptions. Assent with regard to the existence of particular properties or particular uses always requires special written agreement. Pictures may show special designs which are different to the standard scope of delivery.

Our products

Interior Glass Systems
System solutions made from glass for a wide range of everyday and office applications

Mechanical Key Systems
Systems that enable access rights and key control to all rooms within the premises

Lodging Systems
Hotel locks and locking systems as well as access management solutions for holiday homes

Electronic Access & Data
Electronic access control and workforce management for efficient access management, security and data collection

Entrance Systems
Automated access solutions for convenient access to buildings

Door Hardware
Solutions for residential or commercial projects

Safe Locks
Security locks for preventing unauthorized access to goods, valuables, information or hazardous substances

Services
Tailor-made services and customized maintenance for long-term functional integrity of access and security solutions
